

JOINT & TISSUE MOBILIZATION

The Percussion Instrument

Percussion therapy is a treatment approach for muscular tension, joint restriction and, believe it or not, constipation. Its percussive action delivers rhythmic waves into the body that help to loosen stagnant tissues and fixated joints.

The Percussion Instrument works to loosen up 'stuck' areas without having to use a manual adjusting force. It feels like your typical massager, but I can assure you that the design and functionality of this instrument makes it much more effective.

Percussive therapy can influence joint mobility, release muscle spasm, promote blood flow, stimulate lymphatic drainage, improve gastro-intestinal motility, and give relief from common aches and pains.

The Arthrostim Instrument

The Arthrostim Instrument provides the doctor with a mechanical alternative to manually adjusting the joints of the body. The Arthrostim produces a succession of quick thrusts that help to loosen joint restrictions.

Loosening joint restrictions can help to alleviate pain and muscular tension. The design of the Arthrostim Instrument also allows the doctor to control the amount of force that is introduced into the patient's body. This makes it ideal for patients experiencing greater levels of pain.

Patients with contraindications to manual adjusting techniques, post-surgical conditions, extreme levels of pain, or those who may just be a little tentative about manual adjusting techniques can all benefit equally from treatments with the Arthrostim Instrument.
